Purpose:

A. To establish the treatment standard for treating patients with complaints of pain.

Authority:

- A. California Health and Safety Code, Division 2.5
- B. California Code of Regulations, Title 22, Division 9

Protocol:

Every patient deserves to have their pain managed. Not all painful conditions require advanced life support (ALS) intervention. Basic life support (BLS) pain management methods (reassurance, adjusting position of comfort, ice or heat, and gentle transport) can be considered before deciding to treat with an analgesic medication.

NOTE: Analgesic medications should be considered in ALL patients complaining of pain. With the exception of Ketamine and Acetaminophen, analgesics should be avoided if the patient's systolic blood pressure (SBP) is <90 mmHg, respiratory rate (RR) is \leq 10 breaths per minute and/or decreased sensorium or suspicion of traumatic brain injury.

BLS

- 1. Assess and support ABC's and needed.
- 2. Supplemental O_2 as necessary to maintain $SpO_2 \ge 94\%$. Use the lowest concentration and flow rate of O_2 as possible. Assess and treat, as appropriate, for underlying cause.
- 3. Transport

ALS

- 1. Advanced Airway adjuncts as needed.
- 2. Cardiac and SpO₂ monitoring...
- 3. Initiate vascular access.
- 4. Document pain scale (sample scale attached below) with initial assessment/vital signs, after each administration of medication, and after all procedures.
- 5. Pain medications shall be titrated to relief if pain not effectively managed with BLS pain management methods.
 - a. Fentanyl Citrate
 - 1 mcg/kg (maximum single dose 100 mcg) slow IV, IO, or IN every 5 minutes. Maximum cumulative dose of 3 mcg/kg (300 mcg) total.
 - b. Morphine Sulfate (if Fentanyl is unavailable)
 - 0.1 mg/kg (maximum single dose 10mg) slow IV, IO, or IN every 5 minutes. Maximum cumulative dose of 0.2 mg/kg (20 mg).

c. Ketamine

- Mix 0.3 mg/kg Ketamine (maximum single dose = 30mg) in 50-100cc normal saline solution (NSS) or D5W and administer slow IV drip over ten (10) minutes.
- If pain remains at, or returns to, moderate or severe, you may administer a second dose of 0.3 mg/kg Ketamine (max dose=30 mg) in 50-100cc NSS or D5W and administer slow IV drip over ten (10) minutes.

d. Acetaminophen

- 1000 mg IV/IO infusion over 15 minutes
- 1000 mg PO

NOTE: Do not administer Ketamine to patients with any of the following:

- Chest pain of suspected cardiac origin
- Pregnancy
- ALOC

Examples of a 0-10 Pain Scale

Very Mild Minor Discomforting Able to adapt to pain 3 Tolerable Distressing Moderate Very Interferes with many Distressing activities. Intense Very Intense Severe Utterly Horrible Patient is disabled and unable to Excruciating function Unbearable independently. 10 Unimaginable Unspeakable

Wong-Baker FACES Pain Rating Scale
