## Purpose:

A. To establish treatment standards for pediatric patients exhibiting signs and symptoms of suspected Narcotic Overdose.

## Authority:

- A. California Health and Safety Code, Division 2.5
- B. California Code of Regulations, Title 22, Division 9

#### Protocol:

- A. The ability to maintain temperature in prehospital settings in pediatric patients is a significant problem with a dose-dependent increase in mortality for temperatures below 37°C or 98.6°F. Simple interventions to prevent hypothermia can reduce mortality. During transport, warm and maintain normal temperature, being careful to avoid hyperthermia.
- B. Perform blood glucose determination.
- C. For any Altered Level of Consciousness (ALOC), consider AEIOUTIPS:

Alcohol	Epilepsy	Insulin	Overdose
Uremia	Trauma	Infection	Psychiatric
Stroke	Cardiovascular		-

## D. Suspected Narcotic Overdose (Consider any of the following):

- 1. Decreased responsiveness (Glasgow Coma Score < 14).
- 2. Inability to respond to simple commands.
- 3. Respiratory insufficiency.
- 4. Pinpoint pupils.
- 5. Bystander or patient history of drug use or paraphernalia on site.

#### BLS

- 1. Supplemental  $O_2$  as necessary to maintain  $SpO_2 \ge 94\%$ . Use the lowest concentration and flow rate of  $O_2$  as possible.
- 2. Naloxone: Administer \*Intranasal (IN) Naloxone per indications noted in PD# 2523 Administration of Naloxone by First Responders.

3. Airway adjuncts as needed as per PD# 8837 – Pediatric Airway Management.

- 4. If trauma is suspected, assess for traumatic injury per PD# 9017.
- 5. Spinal motion restriction when indicated per PD# 8044.
- 6. Perform blood glucose determination and treat per PD# 9007 Pediatric Diabetic Emergencies.
- 7. If the patient is seizing, protect the patient from further injury and treat per

PD# 9008 – Pediatric Seizures.

8. Transport

#### ALS

- 1. initiate vascular access and titrate to an SBP appropriate for age.
- 2. Naloxone:
  - Preferred routes are IV or Intranasal (IN). Can also be given IM when IV or IN is difficult or impossible. 0.1 mg/kg IV/IN/IM push titrate to adequate respiratory status or a maximum of 2.0 mg.
- 3. If no improvement, consider repeating doses two (2) times (a total of three (3) doses). Reassess after each dose.
- 4. Cardiac monitoring.

\*Intranasal medications are to be delivered through an atomization device with one-half the indicated dose administered in each nostril.

# E. Beta Blocker or Calcium Channel Blocker Overdose:

BLS
1. Supplemental $O_2$ as necessary to maintain $SpO_2 \ge 94\%$ . Use the lowest concentration
and flow rate of O <sub>2</sub> as possible. 2. Airway adjuncts as needed.
3. Transport.
*If poison control has been contacted, relay the poison control information/advice to the base
hospital.
ALS
1. Cardiac Monitoring
2. Establish vascular access and administer 20 ml/Kg fluid challenge if systolic blood
pressure (SBP) is less than the minimum for age.
3. Atropine:
<ul> <li>0.02 mg/kg IV/IO; minimum dose 0.1 mg with repeated dose after five (5) minutes for age-specific bradycardia with hypotension.</li> </ul>
4. Push Dose Epinephrine:
0.01 ma/ml (10mca/ml) 0.5-2 ml (5-20mca) IV/IO every 2-5 minutes. Titrate to SBP for

0.01 mg/ml (10mcg/ml) 0.5-2 ml (5-20mcg) IV/IO every 2-5 minutes. Titrate to SBP for the patient's age, improvement of symptoms, or a total of 0.3mg is given. **NOTE:** Monitor SBP while administering/titrating.

# F. Tricyclic and Related Compounds Overdose:

# BLS 1. Supplemental $O_2$ as necessary to maintain $SpO_2 \ge 94\%$ . Use the lowest concentration and flow rate of $O_2$ as possible.

- 2. Airway adjuncts as needed.
- 3. Transport.

\*If poison control has been contacted, relay the poison control information/advice to the base hospital.

ALS			
1. Cardiac Monitoring.			
2. Establish vascular access.			
3. SODIUM BICARBONATE:			
<ul> <li>a. 1 mEq/Kg IV/IO push if any of the following signs of cardiac toxicity are present:</li> </ul>			
<ul> <li>Heart rate greater than 20 beats per minute above max for age.</li> </ul>			
<ul> <li>Systolic blood pressure less than minimum for age.</li> </ul>			
<ul> <li>QRS complex greater than .12 msec.</li> </ul>			
Seizures.			
<ul> <li>Premature Ventricular Contractions (PVCs) greater than 6 a minute.</li> </ul>
